

SUBJECT: Improved paint setup for underwheel lifts with runways

We are happy to inform you that we have implemented an improved paint setup for our underwheel type lifts with runways.

All runways and additional parts, like filling pieces, slip plates and lift table platforms, are now treated with sandblasting before painting, in order to improve the corrosion protection. This feature is added without any extra cost on sale price.

This important improvement is valid for following models:

- 4-posts lifts, series Teco 4004, Teco 5004: already implemented since several months.
- Underwheel scissor lifts, series Teco 4300, Teco 5000, Teco XT5000, Teco XT6500: will be automatically implemented on all lifts produced from January 2023.

Sandblasting cleans the surface of the parts before painting, to remove any impurities, like grease or rust, using an abrasive medium. This technique creates small scratches on the surface, which help the paint to cover and better bond with the surface of the lift. Furthermore, sandblasted and painted finishes are more resistant to chemicals and can better withstand extreme workshop environments, as they are less likely to chip, crack or wear from contact.

With this improvement we will increase the durability and longevity of our lifts, making them better products in terms of overall quality and market appeal.
